

Bannerman Energy Limited (ASX:BMN)

Analysts: Ryan McCarthy, David Berry, Gabriel Pereyra, Noah Linaker, Paul Bezuidenhout

Executive Summary

We issue a **BUY** recommendation \$5.75 (28.06%) on Bannerman Energy Limited (ASX: BMN), as progression towards production underpins a potential re-rate from developer to producer

Share Price Summary

Bannerman's share price has reached all time highs this year, supported by rising uranium prices and growing market confidence in its increasingly de-risked pathway to production; During Apr 2024 to Apr 2026 BMN price has increased 20.05%

Share Performance

Rebased at 100 as at 10/04/2026

Source: LSEG Workspace

Business Overview

Bannerman is a single asset uranium developer with Etango-8 being their large-scale, long-life uranium project with a clear pathway to producing 3.5Mlbs p.a.

Etango Operations

Bannerman Energy: Building Towards Major Production

Development	Production
2015: Proof of concept - Test plant confirmed heap leach process works at Etango. 2020: Etango-8 concept defined - Introduced XT & XP versions to meet demand. 2021: Pre-feasibility study (PFS) - Confirmed technical and economical viability. 2022: Final study (DFS & FEED) - Completed Definitive Feasibility Study (DFS) and detailed engineering (FEED). 2023: Mining licence granted - Government approval to build and operate. 2024/25: Engineering complete & early works - Design finalised and site infrastructure underway. 2026: Strategic financing agreement - CNNC partnership secured to enable future production. 2026H2: Final Investment Decision (FID) & construction - FID made and full-scale construction begins. 2028/29: First production - Target for first Uranium output and sale.	8 Mtpa Throughput capacity 3.5 Mlbs p.a. Average annual U3O8 output 16-27yrs Mine life 52.6 Mlbs Total U3O8 production 224.9 Mlbs Resource base

Source: Company Reports

Asset Overview

Etango-8 provides Bannerman with the flexibility to grow production inline with demand, creating a practical starting point with strong long-term upside

Etango-8 Overview

Ownership	52.25% Bannerman Energy, 42.75% CNNC Overseas Limited, 5% One Economy Foundation

Competitive Landscape

Bannerman screens around peer averages on a resource and reserve basis, with weaker grade partly offset by moderate recovery and competitive costs at a higher production scale

Bannerman mitigates a low grade with a moderate recovery rate...

... and has competitive costs at a higher production scale

Sources: Annual Reports, Definitive Feasibility Studies, Bloomberg

Uranium Cost Curve

As uranium demand increases and the market moves toward higher incentive prices, Bannerman looks better protected despite sitting higher on the cost curve

Rising Uranium Prices Improve the Viability of Higher-Cost Supply

LHS = All-in-sustaining cost (US\$/lb) / X-Axis = Annual production (Mlbs)

Sources: Company Reports, Bloomberg, LSEG Workspace

Industry Overview

A commodity at the intersection of energy security, AI infrastructure and climate policy

Uranium Prices

US\$/lb

Industry Drivers

Looking forward

Net-Zero Cannot be Achieved on Renewables Alone

Intermittent solar and wind cannot provide reliable baseload power, so governments are turning to nuclear energy, powered by uranium, to fulfill net-zero efforts

Rise of AI Power Demand

AI data centres require continuous uninterruptible power that intermittent renewables cannot provide. Nuclear energy is currently the only scalable zero carbon solution

Government Commitments

At COP28, 22 nations committed to tripling nuclear capacity by 2050. The US designated uranium a critical mineral and committed US\$80B for new reactor construction

Uranium Producer and Developer Landscape

Uranium Demand

Uranium demand is structurally strengthening, supported by long-term reactor commitments, life extensions, near-term restarts, and rising uranium intensity from enrichment constraints

Global Reactor Commitments Drive Long-term Demand

LHS: Number of reactors (hundreds)

Prolonged Reactor Lifecycles Sustains Long-term Demand

LHS: Age of reactor at shutdown year

Reactivation of Existing Infrastructure Fuels Short-term Demand

LHS: Japan's number of reactors | RHS: Nuclear share of energy supply

Enrichment Constraints Increase Uranium Required Per Unit of Fuel

LHS: Uranium required in Kg/KWh | RHS: SWU required

Sources: World Nuclear Association, IEA World Energy Outlook 2024, IAEA PRIS Database, UxC, Bloomberg

Uranium Supply

Uranium demand is rising rapidly while supply remains inelastic and slow to respond, with additional risk from concentration in both mine production and enrichment.

Structural Supply Deficit Emerging

LHS: Uranium, Mlbs

Supply Constraints Hinder Production Growth

Looking Forward

- Long Development Timelines**
New uranium projects typically require 10–15+ years from discovery to production, limiting near-term supply responsiveness
- Underinvestment in New Supply**
Prolonged low uranium prices post-Fukushima suppressed investment, resulting in a limited pipeline of development-ready projects
- Concentrated & Inelastic Supply**
Production is dominated by a small number of producers, with limited incentive to rapidly increase output

Concentrated Uranium Mine Production

Uranium production by country, tU

Concentrated Fuel Cycle Infrastructure Dominated by Politically Sensitive Areas

Share of global enrichment volume

Sources: World Nuclear Association, UxC, Kazatomprom Investor Reports, Cameco Filings, Bloomberg

The Role of SPUT in Bannerman prices

Sprott Physical Uranium Trust allows investors to trade physical uranium directly, having never sold, they tighten supply when trading at a premium to NAV

SPUT Operational Process

Why SPUT Matters to Bannerman

- Supply & Demand

Removes uranium from spot supply and creates direct physical demand
- Market Conditions

Operates in a thin, illiquid market and can intensify upward price pressure
- Security

Self-interest prevents SPUT from flooding market with supply

URNM Affected by SPUT

BMN Affected by SPUT

Source: Sprott Website

Thesis 1: Operation Expansion

The CNNC joint venture removes the funding overhang on Etango-8, leaving the market to reassess Bannerman's longer-dated XT and XP expansion upside

How the Joint Venture Changed the Funding Picture

The joint venture lifted Bannerman's cash position above Etango-8's development cost while keeping debt at zero

Account	Before Joint Venture	After Joint Venture
Cash Position	A\$89.3M	A\$507.2M
Debt Outstanding	Zero	Zero
Etango-8 Development Cost - A\$90.6M		

Why Weren't the Expansions Priced In?

Limited study maturity and execution gating kept XP and XT outside the market's base case

No DFS, reserve or sufficient cost confidence

*"Developing **Etango** at 8Mtpa remains our **core focus**"* – Gavin Chamberlain, CEO

Expansion depends on Etango-8's operating performance

Sources: Argonaut Best Undeveloped Projects 2025, Bloomberg

Pre-JV Consensus Priced Etango-8 Only; The JV Closed the Gap, Leaving XT and XP Unpriced

LHS: A\$

Differentiating the Key Constraints of Etango-XT and Etango-XP

XT is a duration story, while XP is a funding and execution story

Etango-XT

Discounted Cash Flow Drag:
Same output as XP, but over 27 years

Long-Dated Infrastructure Risk:
Relies on existing infrastructure lasting over a longer mine life

Etango-XP

Expansion Capex Hurdle:
Requires an additional US\$325M of capex

Further Optimisation Required:
Assumes a second identical 8Mtpa train with limited integration

Thesis 1: Operation Expansion

The CNNC joint venture increases the likelihood of expansion by combining partner expertise with a supportive uranium market, shared development risk and greater funding flexibility from Bannerman's cash position

CNNC Patient Through the Full Uranium Cycle at Paladin's Langer Heinrich

LHS: Langer Heinrich annual uranium production (Mlbs)

Bannerman Uranium Market Outlook

LHS: Uranium (Mlbs)

Shared Risk, Secured Revenue

CNNC absorbs 45% of all future costs while committing to 60% of production for the life of mine

Bannerman Could Ultimately Fund the Full Etango-XP Expansion before FID in FY34

LHS: A\$m

Sources: Company Reports, Bloomberg

Thesis 1: Operation Expansion

XP offers greater valuation upside by bringing forward production and free cash flow, though this comes with a higher risk profile due to its added capital intensity and execution complexity

Etango-XT Production & FCF

LHS: Milled production / RHS: A\$m

Etango-XT Valuation Summary

Assets	A\$/sh
Etango	3.28
Resources	0.44
Corporate Overheads	(0.12)
Cash (post transaction)	2.23

Etango	6.14
Resources	0.74
Corporate Overheads	(0.12)
Cash (post transaction)	2.23
Debt	-
Price Target	8.99

Source: Company Reports

Thesis 2: Geopolitical Supply Gap

Geopolitical diversification is concentrating demand toward aligned suppliers, creating a near-term supply gap that positions Bannerman to benefit from increased contracting leverage

Western Demand Exceeds Geopolitically Aligned Uranium Supply

Global market estimates (tU)

US Pays a Consistent Premium for Western Aligned Suppliers

LHS: Weighted average price \$US/lbs

Bannerman's Share of Etango-8 Production Remains Largely Uncontracted

Etango-8 uranium production (Mlbs)

Sources: World Nuclear Association, U.S. Energy Information Administration (EIA), Euratom Supply Agency, UxC, Bloomberg

Thesis 3: Additional Development Upside

As Bannerman transitions into a cash generative producer, it gains the flexibility to consolidate stranded uranium assets and unlock further development upsides

M&A Rationale

Bannerman Shows Ability to Develop

Taking Etango from DFS through CNOL partnership to construction demonstrates BMN’s capability to progress assets from study-stage to production.

Large Near-Term Cash Generation

A fully-ramped Etango from FY30 generates ~A\$250m+ annual FCF at BMN’s 52.25% interest. These funds must be allocated either to shareholders, resource expansion or acquisition of uranium assets.

Value Uplift from Development of Asset

Due to market and regional uncertainties, investors require proof of stable production to price projects appropriately.

Cash Breakdown

A\$m

Potential M&A Targets

Asset (Country)	Primary Owner	Stage of Development	Reserve/Resources (Mlbs)	Comments
Tiris Project <i>Mauritania</i>	Aura Energy	Late development (FID)	22.6 / 91.3	A low-cost underdeveloped uranium project in the world but stranded without capital to build it.
Norasa Project <i>Namibia</i>	Forsys Metals	Late development (stalled)	91 / 126	A fully permitted, DFS-complete uranium project sitting 60km from Etango that hasn't been touched in a decade.
Kappies & Hirabeb <i>Namibia</i>	Elevate Uranium	Early exploration (pre-scoping)	NA / 160.5	The largest uranium tenement holder in Namibia with shallow resources and a proprietary processing technology.

Source: Companies DFS Reports

Thesis 3: Additional Development Upside

Three differentiated acquisition structures, each designed to capture strategic value without compromising Bannerman's position

Why Aura Energy?

Geographic de-risking

Takes BMN from single country producer to a two-country African uranium producer

Funded and permit-ready asset

Permitted, near-production asset with US government debt funding already secured

Why Forsys Metals?

Direct operational synergies

Shares camp, port, power, workforce and government relationships with Etango

Capital-light reserve access

Secures a permitted, construction-ready 91Mlb reserve without the cost of takeover

Why Elevate Uranium?

U-pgrade technology

Applies patented processing tech to cut expansion capex and opex

Dominant Namibian tenement base

Creates a consolidated Erongo-based operation with 368Mlbs of resource

Proposed Funding Structure – Acquisition

Component	% of deal	Comment
BMN scrip to Aura shareholder	~60%	BMN issues new shares directly to Aura's existing shareholders
Cash	~30%	Funded via prepaid offtake agreement with Western utility
Deferred Cash	~10%	Paid in two tranches against FID and first-production milestones

Proposed Funding Structure – Joint Venture (Norasa Project)

Component	% of deal	Comment
Cash	50%	Straight cash from Bannerman
Feasibility study funding	20%	Straight cash from Bannerman

Proposed Funding Structure – Merger (Asset Carveout)

Component	Comment
Cash purchase of Kabbies & Hirabeb tenements	Straight cash from Bannerman
U-pgrade exclusive license for Etango ore	Cash licencing fee + a royalty on pounds processed using U-pgrade for Etango ore.
Scoping study commitment on Kabbies & Hirabeb	Straight cash from Bannerman

Football Field Analysis

Our A\$5.75 base case target price implies 28.06% upside, underpinned by a valuation re-rating as Bannerman de-risks Etango and moves from developer towards producer

Indicative Valuation Range (\$A)

Valuation

Bannerman's A\$5.75 valuation is primarily driven by the long-term cash flow potential of Etango-8, with additional potential upside from its operational flexibility to scale beyond FY35

Catalysts

Near-term milestones and macro tailwinds aligning towards a material re-rating

Catalyst Timeline

Bannerman Specific Catalysts

Final Investment Decision

-H2 2026

Critical near-term catalyst, formally committing Bannerman to full scale construction and eliminating the development stage discount from valuation

Production Offtake Expansion

2026-2028

60% of production is committed to CNOL. A Tier-1 North American utility contract covers 1.0Mlbs/yr, leaving the remaining production to be contracted

First Production Date

Expected 2028

The first re-rating catalyst that occurs when Bannerman starts generating operational revenue reducing the developer discount

Macro Catalysts

Big Tech and AI Investment

Current

Growing Big Tech investment in nuclear power to fuel AI data centers is expanding uranium demand beyond traditional utilities, driving upward pressure on prices

Supply Side Troubles

Current

Kazatomprom has missed guidance for three consecutive years, Niger remains disrupted and Russian supply faces sanctions

Russian Import Ban

2028

From 2028, US utilities are legally prohibited from sourcing uranium from Russia, directly redirecting demand toward western accessible producers

Management & Ownership

A purpose-built leadership team positioned for the transition from developer to producer

Key Management Personal

Name	Experience
Brandon Munro <i>Executive Chairman</i>	Driving force behind Bannerman since 2016. Engineered the CNNC deal and grew the company from unfeasible to a construction ready project with a Tier-1 strategic partner
Gavin Chamberlain <i>MD/CEO</i>	Project director for the development for the US\$2bn Husab uranium mine in Namibia. Built in the same jurisdiction and on the same geological formation as Etango
Twapewa Kadhikwa <i>Chairperson - Namibia</i>	A Namibian national serving as local board chair. In a jurisdiction actively considering new mining ownership requirements she provides a credible local voice to maintain relations

2025 Remuneration of Key Personnel

Remuneration in AUD\$

Corporate Restructure

A deliberate 2024 restructure anticipates the construction phase ahead

Strategic Leadership Transition

As Etango approaches its production stage, Munro transitioned from CEO to Executive Chairman and Chamberlain was appointed CEO

Construction Specialist CEO

Chamberlain brings experience overseeing the delivery of a major uranium project in Namibia, with specialised expertise in the construction and production phase BMN is now entering

Munro's Role as Executive Chairman

Retaining Munro in an oversight role preserves a decade of Bannerman-specific knowledge and uranium industry expertise through the company's most critical phase.

Ownership

Sources: LSEG Workspace, Annual Reports

Risk Analysis

The main risks that Bannerman is exposed to are already appropriately mitigated

Effect of Risk on the Share Price

A\$/sh

Key Risks and Bannerman’s Mitigation

Environmental and Operational Risk
Risk: Radiation containment, water availability, waste handling, and land disturbance could disrupt operations or raise costs.
Mitigation: Environmental approvals and pilot-tested heap leach process

Strategic Partner Risk
Risk: Dependence on major contractors, long-lead items, and strategic counterparties can create execution risk.
Mitigation: CNNC/CNOL partnership and retained marketing flexibility

Diversification Risk
Risk: Bannerman is effectively a single-asset, single-country story through Etango in Namibia, so adverse political, regulatory, or project-specific events could have an outsized impact.
Mitigation: Fully permitted Etango in established uranium jurisdiction

Regulatory and Approval Risk
Risk: Mining projects remain exposed to license conditions, policy changes, environmental compliance, and international uranium trade settings.
Mitigation: Existing licenses, approvals, and Namibian operating experience

Source: Company Reports

Bannerman's ESG framework combines a strong safety culture, meaningful community investment and low-impact uranium exposure, with executive incentives directly aligned to ESG delivery

ESG Framework

Safety & Wellbeing

- Bannerman's safety culture is evidenced by **16 consecutive years without a lost-time injury**
- Zero LTIs recorded** during the 2024/25 reporting period

Environmental Stewardship

- Construction waste actively tracked; **30m³ general, 26m³ recyclable, 18m³ hazardous and 300m³ sewage removed** to permitted facilities since construction commenced

Accountability & Oversight

- Safety, Environmental & Community carries the **a large executive KPI weighting at 26%, scoring 88% in FY2025**
- Aligned to all **17 United Nations Sustainable Development Goals** across its People, Planet and Performance pillars

Diversity & Inclusion

- Women represent 40%** of the Board (2 of 5)
- Local **Namibian employment prioritised** at all levels

Community & Social Licence

- Total social investment committed in 2025 was **N\$2.6 million**
- 3,000+ children reached** since 2011
- Receipt of the 2023 African Mining Indaba's **ESG Award for Community Engagement**

Nuclear has one of the Lowest Ecosystem Impacts of any Energy Source

X-Axis: Species-years of biodiversity loss per MWh generated

ESG-Linked Incentives Embedded in Executive KPIs

ESG Comparison

Bannerman leads the peer group on every measurable ESG metric, though with all five companies still in development, direct comparison has its limits

BMN	AEE	AEU	AEU	AEU
Bannerman Energy	Aura Energy	Atomic Eagle	Deep Yellow	Lotus Resources
POSITIVES: 16 consecutive years zero lost-time injuries - ESG = 26% of exec KPIs, scored 88% in FY25 2023 African Mining Indaba ESG Award for Community Engagement	POSITIVES: - All environmental and mining approvals in place for Tiris - Brought in a specialist to build their ESG program from scratch in 2024	POSITIVES: - Zambia ranks 3rd in Africa, Fraser Institute 2024 mining attractiveness 100% ownership; clean corporate structure	POSITIVES: 6th annual sustainability report 41% women in Namibian workforce - Namibia; Top-tier, stable uranium jurisdiction	POSITIVES: - Mine restart achieved Aug 2025; binding offtake secured to 2029 - Community Development Agreement signed Jan 2025 (0.45% of revenues)
CONCERNS: No operating mine yet, ESG record built without the pressures of active uranium production.	CONCERNS: Mauritania ranks 130th/180 on Transparency International Corruption Index.	CONCERNS: Company only formed in Nov 2025, no ESG history whatsoever.	CONCERNS: 5 legal challenges to a Mining Licence since 2011, most recent Feb 2025 in Namibia High Court Persistent community opposition undermines social licence.	CONCERNS: Mar 2026 audit: uranium in drinking water above legal limit; zero chlorine; 28 gastroenteritis cases. Management told workers water was "safe" days before auditors found it was not.

Appendix

Appendix 1: Jurisdiction Risk

Etango's Namibian jurisdiction risk is mitigated by the country's long-established uranium industry, existing mining and export infrastructure, openness to foreign operators, and a supportive policy environment that continues to back new development

Project Location

Namibia as a Mining Jurisdiction

Scale, infrastructure and location

Existing Mining Infrastructure

Namibia benefits from more than 40 years of accumulated uranium mining infrastructure, including established roads, power, logistics networks and a skilled mining workforce

Foreign Investment Presence

Namibia hosts a range of international uranium operators and developers, including Paladin (Australia), Deep Yellow (Australia), CNNC (China), CGN (China) and Forsys (Canada).

Strategic Mine Location

The project sits close to key infrastructure, with nearby access to Swakopmund, Walvis Bay, the international airport, rail and desalination capacity

Supportive Policy Backdrop

Pro-uranium policy with low permitting risk

Established Uranium Industry

Namibia is the world's third-largest uranium producer, with mining contributing about 10% of GDP and 50% of total exports.

Supportive Government Stance

Uranium has been declared a strategic mineral, and the government is actively promoting new mine development.

Limited Policy Risk

The proposed 51% ownership push remains at the consultation stage only, is not statutory, and Etango is already fully permitted.

Appendix 2: Is Partnering With China A Risk?

CNNC is a proven non-risk partner in the uranium industry, while Etango-8 remains majority Australian-owned and increasingly valuable in a supply-constrained western market

Case Study

Paladin's Langer Heinrich shows CNNC's minority ownership has not prevented western customer access

Control, Capital and Market Need

Bannerman keeps control, Chinese capital is not unusual, and tightening uranium supply outweigh partner optics

Appendix 3: Shareholder Protections

The CNNC joint venture is structured to preserve Bannerman's operational control, prevent shareholder dilution, and eliminate any pathway to a foreign takeover

Ownership Control

Bannerman holds the chair, the CEO, and the casting vote

3 of 5 Board Seats

Bannerman appoints 3 of 5 JVCo board directors; Same composition applies to BMRN

3 of 5 Executive Roles

Bannerman appoints 3 of 5 key specified executive management roles at BMRN level, including the CEO

Ownership Locked

55/45 ratio is the party's stated intention; Neither party can increase their direct or indirect interest in JVCo or Etango

Creep Protection

Three independent barriers prevent CNNC from ever building a controlling stake

9.9%

SOE HARD CAP

CNNC as a State-Owned Enterprise cannot build a stake in Bannerman above 9.9% without FIRB approval

Standstill

BILATERAL LOCK

Neither CNOL nor Bannerman may acquire shares in the other's listed company without prior consent of both parties

Wall

TAKEOVERS PANEL

Any predatory move triggers the Takeovers Panel, a structural deterrent that shuts down attempts almost immediately

Strategic Decisions

No major decision moves without Bannerman's consent

Unanimous Veto on Key Decisions

All material financing, funding, and development decisions require unanimous JVCo Board or shareholder approval, Bannerman's consent is non-negotiable

Mutual Standstill on Listed Shares

Neither NCOL nor Bannerman may acquire shares in the other's listed company without prior consent

Shareholder Loan Protection

No shareholder can enforce repayment of JVCo loans against the other without mutual consent, preventing financial pressuring

Regulatory Shield

The deal was structured specifically to sit outside FIRB's reach

FIRB Has No Jurisdiction Here

Transaction occurs at UK HoldCo level, FIRB is only triggered by direct acquisition of an Australian company or Australian assets, which doesn't apply

AVZ Precedent Engineered Out

AVZ faced FIRB scrutiny when Chinese investment reached Australian assets through offshore structures offshore structures, Bannerman's deal was engineered to avoid that

Chinese Backdoor Takeover is Structurally Impossible

FIRB caps State-Owned Enterprise ownership at 9.9% + bilateral standstill + Takeovers Panel

Appendix 4: The Iran Conflict

The conflict has simultaneously accelerated nuclear demand and constrained the supply sources Western utilities can access

The Impact of Rising Oil Prices on Bannerman's Operations

Limited Near-term Exposure

As a pre-production developer, Bannerman has no operational oil dependency. Rising fuel costs have no direct impact on Etango's uranium output or project economics.

Construction Cost Headwind

Higher diesel prices increase construction phase expenses, although Etango's heap leach process remains materially less energy-intensive than conventional mining operations.

Accelerating the Energy Security Crisis

Rising oil prices expose the risk of fossil fuel dependency. Governments facing energy inflation are being forced to accelerate structural transitions toward reliable energy sources.

Geopolitical Supply Re-Routing Away from the Russia/Kazakhstan Axis

Western Utilities Diversifying Away From Exposed Supply

Russian import restrictions, Niger's post coup disruption and Kazakhstan's Russian alignment simultaneously eliminating Western utility procurement options.

The Axis of Geopolitical Risk

Russia, Kazakhstan and Niger collectively supply over 50% of global uranium. All three nations carry acute geopolitical risk that Western governments are legislating against.

Namibia as the Primary Beneficiary

NexGen's Arrow deposit is entering construction in 2026 and four years from first production, Etango remains the only large-scale Western-accessible projects supplying before 2030.

The Shift Away from Oil Accelerating Nuclear Demand

Accelerating Need for Nuclear Demand

Disrupting 20% of global oil supply accelerated the demand for nuclear from a long-term strategic preference into a greater near-term energy security.

Namibian Nuclear Supply

Namibian uranium is insulated from Hormuz disruption, making it one of the most geopolitically secure energy sources.

A New Wave of Nuclear Demand

Fuel cost volatility is fast-tracking long-term nuclear procurement, directly expanding the uranium demand that Bannerman is being built to supply.

Kazatomprom Missed Guidance

Mlbs

Appendix 5: Debt Financing

Western debt has overtaken Eastern financing as the dominant force of uranium capital, and Bannerman's peers are the ones raising it

West Vs East Debt Funding

LHS: US\$m

Bannerman's Appeal to Lenders

Proven management track record

Bannerman's leadership team combines direct Namibian mining experience with decades of uranium sector expertise, giving lenders the execution risk that first time operators can't offer.

Tier-one uranium jurisdiction

Namibia is Africa's main uranium jurisdiction with multiple active Western project debt facilities within the Erongo area.

Track record of advancing Etango

Bannerman has successfully progressed Etango from exploration through DFS, full permitting, and front-end engineering. The same execution pathway every recent uranium borrower completed before lenders approved debt.

Adjacent projects to Forsys Metals used western debt

Metric	Paladin	Forsys Metals	Deep Yellow
Project	Langer Heinrich	Norasa	Tumas
Resource	~100Mlbs	91Mlbs	~118Mlbs
Capex	US\$125m restart	~US\$210m	US\$360m
Location	Erongo, Namibia	Erongo, Namibia	Erongo, Namibia
Permits	Operating	Granted	Granted
Debt Raised	US\$260m	~US\$150-180m	TBD (Nedbank mandated)
Lender	Nedbank & Macquarie	-	Nedbank

Adjacent projects to Elevate Uranium used western debt

Metric	Lotus Resources	Elevate Uranium	Peninsula Energy
Project	Kayelekera	Kappies & Hirabeb	Lance
Stage	Restart	Exploration/early development	Restart
Capex	US\$88m	~US\$35m	US\$50m
Technology	Conventional	U-pgrade beneficiation	ISR
Jurisdiction	Malawi	Namibia	USA
Debt Raised	US\$53.5m	-	US\$15m
Lender	Curzon + multi-party	-	Davidson Kempner

Appendix 6: SPUT Never Sells

SPUT is invested in Uranium; Self-interest prevents them from selling

Assets Under Management

Uranium is 15% of AUM. This relies on the growth of Uranium prices. Selling uranium would be detrimental to this side of the entity.

Specific Exposure

Uranium exposure is spread across both Uranium physical assets and Equities. Selling Uranium reduces the value of both classes

Vehicle	Exposure	Effect of Low Uranium Price
SPUT	Physical Uranium	Reduce NAV of inventory
URNM	Uranium + Equities	Pressure Miners and AUM
URNJ	Junior Equities	High sensitivity to sentiment/price

Preventative Factors

Several Exposure Issues Prevent Sprott from Flooding the market

AUM Exposure

15% of AUM are in Uranium. Selling drives the price of Uranium down, and this sector of the entity suffers.

Physical and Equity Exposure

Not only does the NAV of the uranium stockpile reduce in value, the companies that Sprott ETFs are comprised of suffer.

Self-inflicted Damage

Pushing Uranium prices downwards is irrational as Sprott itself would be negatively effected. They would not exit their position without heavy losses.

Entanglement

The diversity of Issuers in Sprott Uranium ETFs highlights the wide influence of Sprott.

26 Unique issuers in URNM

Well established equities and physical uranium storage companies (SPUT and Yellowcake PLC)

13 Additional Unique Issuers in URNJ

Includes junior uranium companies that are more sensitive to Uranium price and sentiment

20 Mutual Issuers

Mutual instruments capture how even well-established Uranium companies are in a high growth phase due to the commodity nature

Appendix 7: Heap Leaching at Etango

Conservative DFS recovery assumptions, Namibian acid supply independence and pre-production status position Bannerman to benefit from competitor constraints rather than share them

Heap Leaching Process at Etango

Mining and Crushing

Ore is mined from open pit, crushed through jaw crushers and cone crushers and then agglomerated with sulphuric acid and hydrogen peroxide.

Heap Construction & Leaching

Crushed ore is staked on lined with surface pads. A dilute sulphuric acid solution is drip-irrigated over the heap, dissolving uranium as it moves downward.

Recovery and Processing

The uranium-bearing leach solution drains from the base, is pumped to the processing plant and uranium is extracted through ion exchange before being dried.

Impact of Iran Conflict on Bannerman's Leaching Process

Pre-Production

Bannerman has no current operational acid consumption, the current Iran conflict supply shock does not have a direct impact on Etango's construction.

South African Supply Chain

Etango's future acid supply is sourced entirely from southern Africa industrial chains, independent of Strait of Hormuz disruption.

Walvis Bay Acid Plant Re-Risks Long-term

A new US\$59 million sulphuric acid plant near Walvis Bay directly secures regional acid supply ahead of Etango's 2028 production commencement.

Heap Leach vs ISR

Factor	Kazatomprom - ISR	Etango Heap - Leach
Acid Delivery	Underground injection through wellfields	Surface drip irrigation onto crushed ore pads
Acid Source	Russia and Kazakhstan domestic, both disrupted	South African regional supply, Hormuz independent
Supply disruption impact	Immediate and proportional production cut	More manageable surface delivery and adjustable irrigation rate
Acid recycling	Limited as it is injected underground and partially lost	Leach solution partially recycled through system
Processing Complexity	high complexity underground infrastructure	Lower complexity gravity driven surface process

Appendix 8: Big Tech and AI Commitments to Nuclear Energy

The world's largest technology companies are becoming uranium's newest demand driver

Current Big Tech Commitments

Company	Commitment Value	Production Start	Duration	Description
Microsoft	US\$16bn	2028	20 years	20-year PPA with Constellation Energy to restart Three Mile Island
Google	Undisclosed	2030	2035+	Agreement with Kairos Power for 500MW fleet of SMRS. First reactor online by 2030
Amazon	US\$18bn	2032	17 years	17-year PPA with Talen Energy for 1,920 MW from Susquehanna nuclear plant
Meta	Undisclosed	2030+	20 years	Deals with Oklo, Vistra and TerraPower for up to 6.6GW of nuclear power by 2035
Oracle	Undisclosed	TBC	TBC	Plans to build data centre campus powered by 3 SMRs. Building permits secured.

Firms Expected to make Commitments Soon

Major tech companies that have not yet made commitments.

Open AI

Sam Altman is a major investor in Oklo (SMR developer). OpenAI has not signed a direct nuclear PPA but Altman has been advocating for nuclear as the only viable AI Power Solution.

Apple

Has committed 100% clean energy across its operations which makes nuclear a natural fit. However, Apple has not yet made any specific nuclear commitments,

Samsung/TSMC

Fabrication of semiconductor's consume enormous amounts of continuous power. With US Fabrication build outs upcoming, nuclear energy supply can help meet energy demands.

Why Nuclear Energy?

Nuclear is the only energy source that meets AI's unique power demands

Continuous and Uninterrupted Power

Data centers require 24/7 uninterruptible power that intermittent solar and wind cannot provide. Nuclear operates at over 90% capacity factor.

Geographic Flexibility

Unlike most net-zero energy options, nuclear plants can be sited directly adjacent to data centre campuses.

Energy Density and Scalability,

A single reactor produces more continuous power from a smaller footprint than any renewable alternative, scaling proportionally with AI compute growth.

Appendix 9: Bannerman Looking to Become a Multi-Asset Producer

Bannerman is positioned for strategic optionality that the market is not pricing

Munro's Strategic Vision

Customer Relationships beyond Etango

Multi Asset Production

Munro has stated that Bannerman aspires to be a multi asset producing company post Etango

Customer Relations

Bannerman's 40% independently marketed production is the foundation of forming proprietary customer relationships

Funding

Post-construction balance sheet credibility and CNNC relationship provides access to Chinese nuclear capital that enables further M&A and partnership activity.

Namibian Critical Minerals (NMI)

Bannerman's Investment into NMI

Bannerman currently maintains 41% ownership of Namibian Critical Minerals, which holds exploration licences beyond uranium. First acquired August 2022.

Raw Materials Partnership

Namibia has signed a strategic raw materials partnership with the EU, to shift supply chain dependence. This will increase raw material demand from Namibia.

Increasing Ownership

Bannerman has quietly been increasing their ownership of NMI. Outlining a potential strategic partnership in the future.

Ownership

%

The Lofdal Project

A key project that aligns with Bannerman's operations

Fully Permitted Asset

Lofdal is a fully permitted heavy rare earth elements project in Namibia, significant for dysprosium and terbium supply.

Same Jurisdiction and Platform

Located in the same Namibian jurisdiction as Etango, Lofdal draws on the same government relations and operational infrastructure Bannerman has built over 15 years.

New Exposure

Lofdal provides rare earth exposure to Bannerman that is outside of uranium and can facilitate Bannerman to expand into a new field of assets.

Appendix 10: Thesis 3 – Assets Owned By Potential Acquisition Targets

Strategically located acquisition targets could accelerate Bannerman's transition into a larger, more dominant uranium producer

Aura Energy (-A\$90m) – Tiris Project, Mauritania

Why Aura Energy?

Aura Cannot Build Alone

Aura currently has \$12m cash and need -US\$230m to construct Tiris Project operations. They are currently seeking a strategic partner.

Low-cost uranium project

AISC of US\$35.70/lb with a 0.8x strip ratio. 2.25yr payback with a US\$56/lb cash margin. Free-dig mining, no crushing required.

Identical Process Method to Etango

Both Etango and Tiris are calcrete-hosted, open pit, heap leach uranium projects.

Forsys Metals (-A\$90m) – Norasa Project, Namibia

Why Forsys Metals?

Adjacent to Etango in the Erongo Region

Norasa sits 60km from Etango project, allowing Bannerman to synergies operations.

Metallurgical Synergies with Etango-8

Confirmed 91.3% recover rate using heap leaching like Etango, enabling processing synergies.

Proven Reserves with Granted Mining Licence

DFS & mining licence complete. Only capex needed to retrieve highly valuable ore deposit.

Elevate Uranium (-A\$120m) – Junior Explorer

Why Elevate Uranium?

Namibian's Largest Uranium Tenement Holder

Largest tenement holder in Namibia with 160.5Mlbs of resources with four new discoveries in four years.

U-pgrade Technology could transform Etango-8

Elevate's patented processing rejects 95% of ore mass before leaching, lifting grades from 93ppm to 5,000ppm in Marenica.

95% of resources with at low-depths

Currently Koppies ore body sits 18.5m below the surface, making it the cheapest uranium mine in Namibia.

Appendix 11: Thesis 1 – Expansion Sensitivities

The key sensitivities for both XP and XT are uranium price, operating costs, foreign exchange rates and capital costs, with uranium price clearly the dominant driver of value

Sensitivity of Etango-XT NPV to Key Inputs (Base US\$65/lb U3O8)

Sensitivity of Etango-XP NPV to Key Inputs (Base US\$65/lb U3O8)

Etango-XT NPV Sensitivity to Key Inputs +/- 10%

Etango-XP NPV Sensitivity to Key Inputs +/- 10%

Appendix 12: CNNC Joint Venture

A US\$321.5M debt-free funding solution that preserves Bannerman's operational control and full uranium price upside, with CNNC aligned as both equity partner and offtake buyer

Bannerman Retains Control

Ownership waterfall

Underlying economic ownership

Deal Structure & Rationale

Optimal funding solution from a global financing process

US\$321.5M DEBT-FREE CAPITAL	- US\$294.5M into JVCo + US\$27M reimbursement on completion - Debt financing route would have required Bannerman to be heavily contracted - Strict covenants would also have constrained operations during the critical construction and ramp-up phases
60% LOM Offtake MARKET-PRICED	- CNOL purchases 60% of production at a blend of spot and long-term index prices - Bannerman retains full exposure to uranium price upside - Bannerman independently markets the remaining 40%
Aligned Partner BUYER AT THE TABLE	- CNNC already operates Rössing (68.6%) and Langer Heinrich (25%) in Namibia - With 18 reactors under construction or approved, CNNC needs uranium supply as much as Bannerman needs the capital - As both equity holder and offtake buyer, their incentives are fully aligned with project success

Appendix 13: Uranium Global ETF

Benchmark ETF for uranium exposure

Top 10 Holdings

Company	Holding (%)	Country
Cameco	23.9	Canada
NexGen Energy	6.23	Canda

Appendix 14: Commodity Breakdown (Mining Process)

Bannerman's Etango-8 mining process flowchart

Appendix 15: Historical Uranium Market Dynamics

A persistent supply deficit, driven by decades of underinvestment and structural demand growth, has historically driven uranium prices, and the conditions for the next cycle are already in place

Appendix 16: Share Price Probability

Under both a historical Geometric Brownian Motion framework and a consensus valuation-anchored mean-reverting framework, the simulations suggest a high likelihood of BMN reaching our \$5.75 target before production

Assuming Prices Follow GBM Process: 90% Probability with 9969.27% Variance

LHS: A\$

Assuming Prices Follow MR Process: 98% Probability with 89.72% Variance

LHS: A\$
